

Expert's Report

given by the RWTÜV Systems GmbH, Essen

on the Application of the Surface Coating Material

“Volvox proAqua Wood Glaze”

in consideration of climatic and hygienic standards within houses

Ecotec Naturfarben GmbH presented us a description of the product's ingredients and their composition which we examined thoroughly in order to determine the concentration of the substances they contain. Our expert opinion is the following:

Result of the investigation:

In consideration of climatic and hygienic standards the application of “Volvox proAqua Wood Glaze” in the interior of buildings is absolutely safe. No emissions of the coat containing any concentration of their substances that would have been detrimental to health could be observed - neither immediately after the application of the product nor over a relatively long period after the end of the drying time.

During and after the application of “Volvox proAqua Wood Glaze” measurements of concentration of the indoor air were taken. While doing so no concentration of the product's substances or organic solvents that would be detrimental to health was observed in the air.

Basis of this judgement is the report on the investigation of the 22nd December 2004, reference number 3.3-3/2, order number 20 66 19 49

Course of the investigation

Normal, usual quantities of the product were applied on a neutral surface. The investigation was carried out in an isolated test room which had no admission of air. Then, at regular intervals, specimens of the air were taken and the respective concentration of the substances was determined.

Essen, 22nd December 2004

Bitzer, B.Sc. (Eng.); B.Sc. (Chem.)
